

Google GWT MVP Model with Activities, Places and device-dependent Views

Lists all *Place* tokenizer classes as type annotation

Mapping to/from tokens for *PlaceHistoryHandler* (generated from *MyPlaceHistoryMapper*)

Enables the *ActivityManager* to automatically discard event listeners of stopped activities.

<<fires>>
PlaceChangeRequestEvent
PlaceChangeEvent

On a complex page combining multiple display areas (or panels) like a list view and a detail view, you will need to implement respective combinations of display area widgets and activity managers. Place changes can be used to elegantly coordinate between multiple display areas.

Always extend *ResizeComposite*, if you want to use the new GWT2.x layout classes!

Relation allowing for bi-directional communication
